

AI-BASED INTELLIGENT ROAD ACCIDENT DETECTION AND EMERGENCY RESPONSE SYSTEM

Technical Field

This invention relates to intelligent transportation systems, artificial intelligence, and automated emergency response technologies.

Title of the Invention

AI-Based Intelligent Road Accident Detection and Emergency Response System

Abstract

The proposed invention is an intelligent system designed to automatically detect road accidents and initiate an emergency response. The system collects and analyzes data related to vehicle movement, sudden impact, abnormal acceleration patterns, and geographical location. Artificial intelligence algorithms evaluate the collected information to determine whether an accident has occurred.

When an accident is detected, the system automatically generates an emergency alert containing the location and relevant incident details. The alert can be transmitted to designated emergency contacts, response systems, or authorized emergency services.

The invention aims to reduce delays in accident reporting and improve the efficiency of emergency response.
